

Emergency First Aid for The Construction Environment

Course Introduction

This course has been developed from the content generally accepted for Emergency First Aid at Work (EFAW) qualifications.

With particular emphasis placed upon workplace injuries typically associated with the industry, this qualification is an ideal replacement for the typical EFAW qualification, providing specificity towards more common injuries sustained on site, and improving the effectiveness of the training.

Upon completion, students will have an understanding of the roles and responsibilities of individuals in relation to first aid, how to execute those responsibilities, in addition to a better understanding of legislation in the workplace.

Please note: we are currently only running private Emergency First Aid for Construction Environments courses for groups or organisations within the industry. Please [contact us online](#) or call 01792 585868 for information including pricing and availability

Course Topics

- Legislation
- Roles and responsibilities
- First aid equipment
